

# **Image Classification**

**Using Deep Learning & Streamlit for Real-Time Image Classification**

**Developer : Aditya Wagh**

# Introduction

- **Image Classification Using CNN:** The project utilizes a Convolutional Neural Network (CNN) to classify images from the CIFAR-10 dataset into 10 categories such as airplanes, cars, and animals.
- **Web-Based Application:** Built with Streamlit, the application allows users to upload images and receive real-time predictions, making it easy to interact with the model.
- **User-Friendly Interface:** The purpose is to provide an accessible and visually appealing platform for users to explore image classification without needing deep technical knowledge.

# Objective

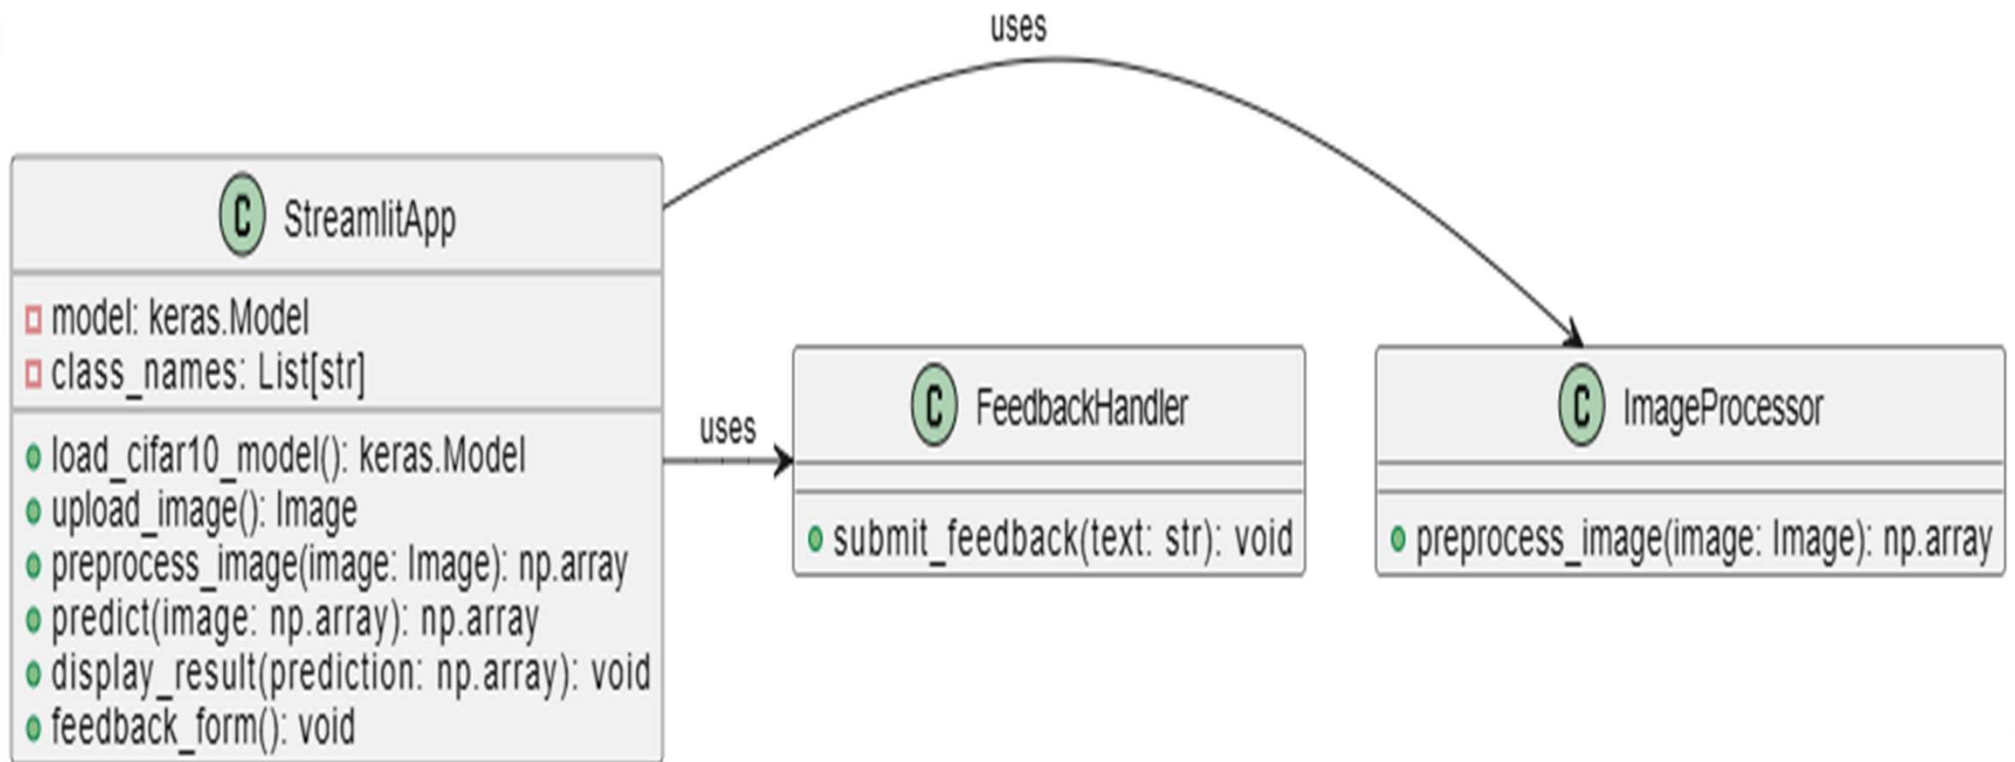

- **Easy Image Classification:** Provide a simple platform where users can upload images and get instant predictions using a Convolutional Neural Network (CNN).
- **Accessible to Everyone:** Make advanced image classification available to non-technical users through a user-friendly interface built with Streamlit.
- **Real-Time Interaction:** Allow users to experience real-time image classification with minimal effort, making it both interactive and engaging.

# Technology Stack

- Python
- TensorFlow
- Streamlit
- CNN (Convolutional Neural Network)
- CIFAR-10 dataset

# Key Features

- Real-Time Predictions: Instantly classify uploaded images using a pre-trained CNN model.
- User-Friendly Interface: Simple and intuitive web design, making it accessible for users without technical expertise.
- Support for Multiple Image Types: Handles common formats like JPG, JPEG, and PNG for easy uploads.

# Future Enhancements

- Improved Model Accuracy: Integrate advanced models like ResNet or EfficientNet for better image classification accuracy.
- Mobile and Cloud Integration: Expand the app to support mobile devices and cloud-based processing for scalability and enhanced accessibility.
- Enhanced User Interface: Add interactive features like drag-and-drop uploads and real-time visual feedback to improve the overall user experience.

# Conclusion

- **Effective Image Classification:** The app successfully classifies images in real-time using a CNN model, making advanced technology easy to use for anyone.
- **Smooth User Experience:** With a simple and interactive design, users can easily upload images and get instant predictions.
- **Room for Improvement:** There are many possibilities to improve the app, like using better models, making it work on mobile devices, and enhancing the user interface.

**THANKYOU !**
